## PATIENT APPLICATIONS

- Keratoconus
- Post Surgical
- Pellucid Marginal Degeneration
- Dry Eye Syndrome*/Corneal Surface Disease
- Stevens-Johnson Syndrome Intolerance
- Keratoglobus
- Astigmatism
- Post-corneal Transplant
- Sjögren’s Syndrome
- Graft versus Host Disease
- Presbyopia
- Corneal GP and Soft Lens

The following materials marked with an * are indicated for the management of dry eye disease. Material indication data was obtained and it is available from the material manufacturer package insert.

The Atlantis scleral design has 3 truly independent zones.

**Central Zone** - This is the optic zone and increases with a diameter increase. On the 15.5 the optic zone is an 8.5. Each individual central SAG can be increased or decreased by a total of 200 microns in 50 micron steps. This will not affect the other 2 zones.

**Limbal Vault Zone** – This zone extends from the outside of the central zone to the inside of the scleral zone and the width of this zone is consistent with each diameter. The SAG of this zone can be increased (up to 200 microns) or decreased (down 100 microns) with no effect on the other 2 zones. The highest point of this zone can also be adjusted out towards the edge of the lens or in towards the optic zone of the lens. Changes are made in 25 micron steps.

**Scleral Zone** – This is the edge of the lens and is roughly 1mm wide. This zone can be manipulated to increase or decrease the SAG of just this zone by 200 microns in each meridian or any quadrant. The changes are done in 25 micron steps and will not affect the central zone SAG or the limbal zone SAG.

### Fitting Set Markings

Lens identification marking

![Diagram of lens identification marking]

**QUADRANT 1**

**QUADRANT 2**

**QUADRANT 3**

**QUADRANT 4**
The Atlantis design provides customizable zone options to provide a simple, streamlined fitting process that reduces chair time. A single fitting set will provide the necessary coverage to fit any corneal SAG or scleral shape.

When using the diagnostic kit to fit the Atlantis scleral lens, we recommend (regardless of K readings or condition) starting with the "X4A" lens.

a. Apply the diagnostic lens with non-preserved saline and fluorescein.

b. Using the CLS evaluation process (Central - 1, Limbal - 2, Scleral - 3)

The ideal fitting relationships are:

1. CZ - completely vault the cornea, approximately 200 to 400 microns of clearance over the most elevated portion of the cornea. A decrease in clearance will occur with wearing time (loss can range from 50 - 150 microns).
To evaluate approximate clearance, compare the clearance to either the corneal thickness or the lens thickness (lens thickness is represented on the lens vial). Example: .28 thickness = 280 microns.

For issues see Troubleshooting in the appendix.
2. Limbal Vault Zone - completely vault the limbus. Avoid limbal touch while keeping clearance at a minimum (approx. 100 mm of clearance)

Small, stagnant bubbles may be acceptable in the Limbal Vault Zone and may resolve over time.
LIMBAL VAULT OPTIONS

This revolutionary enhancement allows the limbal sag apex to be adjusted in/out or up/down, optimizing mid-peripheral clearance.

This design feature allows custom enhancements for multiple corneal conditions, such as; oblate (post myopic lasik, RK, etc...) and prolate (ectasias, trauma, etc...). This design feature can be fit utilizing the standard Atlantis fit set.
3. Scleral Zone - uniform alignment 360°
Look for disruption of vessels at the edge, blanching, impingement, and/or edge lift.

Edge alignment

Edge impingement

Edge Lift
ASYMMETRIC SCLERAL ZONES

Studies have shown that as you move further away from the limbal area, the sclera often has more toricity and in some cases quadrant asymmetry.

With the Atlantis design, you have the ability to adjust the scleral zone by quadrant to better align with the sclera. Whether the scleral shape is with the rule, against the rule or oblique, the laser marks will align with the steeper of the two meridians.

Inferior edge standoff  Nasal blanching

For toric or quadrant specific scleral zones, patient lenses will be marked with three dots always representing quadrants 2, 3, and 4.

Images on this page are courtesy of Buddy Russell, COMT, FCLSA, FSLS
FLEXURE & RESIDUAL ASTIGMATISM

It is best to determine if the residual astigmatism is due to any lens flexure prior to ordering front toric optics.

Determine if lens flexure is present. With the scleral lens on the eye, simply perform keratometry or topography. If keratometric readings (or Sim K) are NOT spherical, increase the center thickness by .10 and stay with spherical optics.

If trial lens on eye shows residual cylinder of 0.75D or greater and does not have a toric scleral zone, order spherical equivalent lens with the following amount of scleral toricity:

- 14.5 start with 50 microns of toricity
- 15.0 start with 100 microns of toricity
- 15.5 start with 150 microns of toricity
- 16.0 start with 200 microns of toricity
- 16.5 start with 250 microns of toricity

If trial lens or patient lens has a toric scleral zone and residual cylinder is still greater than 0.75D:

- Use slit lamp reticule to determine steep meridian axis
- Quadrants 2 and 4 marks steep meridian

PATIENT LENS
FRONT TORIC CALCULATION

1. Call Consultant with steep meridian axis, over refraction, and trial or patient lens information for final lens parameters.

2. Use the following examples to determine final lens power.

**Algorithm for calculating cylinder axis on lenses:**

A = Over refraction axis (x130 in example below)

B = Steep axis of scleral (x20 in example below)

Example 1 - If A - B is positive, then lens cylinder axis = A - B (130 - 20)

Example 2 - A - B is negative, then lens cylinder axis = 180 + A - B (130 - 150)

**Example 1:**

Over refraction: -3.00 -1.50 x130

Steep axis x20 = -3.00 -1.50 x130 – x20

Final lens power and axis = -3.00 -1.50 x110

**LARS: Left Add, Right Subtract**

Evaluating from the 0/180 meridian, determine steep meridian (Quadrants 2 and 4) using slit lamp reticule.

Using LARS method, each clock hour represents 30 degrees.

Lens rotated 20° to the right.

OR -3.00 -1.50 x130

Right subtract

130 - 20 = 110
Example 2:

If OR axis is less than steep axis
OR -3.00 -1.50 x130
Steep axis after settling from reticule measurement x150
-3.00 -1.50 x (180 + (130 - 150))
Final lens power and axis = -3.00 -1.50 x160

LARS: Left Add, Right Subtract:

Evaluating from the 0/180 meridian, determine steep meridian (Quadrants 2 and 4) using slit lamp reticule.

Using LARS method, each clock hour represents 30 degrees

The steep axis marks on the lens should be in the exact same position as those of the first diagnostic lens. LARS is used to eliminate the axis misalignment resulting from lens rotation and NOT TO ELIMINATE THE ROTATION.
The Atlantis also offers a center distance scleral lens multifocal option. No additional diagnostic kit is needed. The only additional parameters to determine is the distance zone diameter and add power. The bi-aspheric multifocal design does not alter the fit of the lens as the sagittal depth is unchanged compared to the single vision Atlantis lens.

Three different distance zone diameters are available: 4.4 mm, 4.0 mm, 3.6 mm

**Fitting the Atlantis Scleral Multifocal**

1. Determine the dominant eye.
2. Determine pupil diameter under normal lighting conditions.
3. Standard distance zone is 4.0 mm. For larger pupil diameters order the 4.4mm and smaller diameters 3.6mm.
4. Order add power determined by refraction.

**Pointers for achieving best vision in the Atlantis Multifocal:**

1. Desires better distance vision.  
   - change distance zone of dominant eye only to 4.4mm
2. Desires better near vision.  
   - change distance zone of non-dominant eye only to 3.6mm
3. Desires BEST distance vision  
   - use 4.4 mm OU
4. Desires BEST near vision  
   - use 3.6 mm OU
CONJUNCTIVAL ELEVATIONS

For those patients with a scleral elevation such as a conjunctival bleb, pinguecula, or pterygium, a final fit lens can be “notched” around the conjunctival irregularity.

Lens design options:
* Smaller diameter that lands before the elevation
* Larger diameter to completely vault the elevation
* Lens Notching

Determining the size of a lens notch is optimized by sending a picture to our consultation team. Physically marking the lens with a sharpie marker or estimating the depth and width in millimeters can also be utilized.
Dispensing Visit

Patient should wear lenses for a minimum of 45 - 60 minutes prior to evaluation. Instruct application and removal, provide appropriate care system, care instructions and discuss increasing wearing time.

At the dispensing visit be sure to discuss warnings and precautions while referring the patient to the package insert and patient instructions for use.

Lens movement will be minimal (similar or less than a soft lens) and there will be very little tear exchange behind the lens.

1. Have patient arrive for follow-up preferably mid-morning to mid-afternoon after applying lenses in the morning.

2. Questions to patient:
   a. How many hours a day are you wearing the lenses?
   b. How is the comfort throughout the day?
   c. How is your vision throughout the day?
   d. Upon removal is there any discomfort or redness?

3. Determine if adequate central and limbal clearance is present with high magnification and optic section illumination and white light (or OCT).
4. For scleral zone evaluation determine if blanching is present. Evaluate edge clearance (none/adequate/excessive) in all meridians.

5. Remove the lens and evaluate the ocular surface for ocular insult.

**Recommended Follow-up Visit Schedule**

- 2 weeks
- 1 month
- 3 months
- 6 months
- **1 year**

**It is recommended that scleral lenses be replaced on an annual basis.**

NO RISK WARRANTY

Unlimited exchanges and cancellation within 90 days of original invoice.

With our Paperless Credit Policy, there is no need to return lenses. Upon exchange, you can request credit at that time. Or, simply submit on our website under Paperless Credits, fax or email your account number, invoice number, patient name, and quantity. We will process your credit and it will appear on your monthly statement.

With the paperless system, you save valuable time and more importantly, costs you incur with packaging and return postage.
